**Approved December 14, 2015**

***Abstract***

In the interests of safety and interchangeability, this Standard provides pressure and velocity performance and dimensional characteristics for centerfire rifle sporting ammunition. Included are procedures and equipment for determining these criteria.

## ***American National Standard***

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval. Purchasers of American National Standards may receive current information of all standards by calling or writing the American National Standards Institute.

## **Foreword**

The development of this voluntary industry performance standard was initiated under the auspices of the Sporting Arms and Ammunition Manufacturers' Institute, Inc. (SAAMI). A Products Standards Task Force was established by the Institute in 1975 and charged with the drafting of this and other standards with their subsequent periodic revisions.

The material presented provides the commercial manufacturer of factory-loaded ammunition with pressure and velocity performance and dimensional characteristics. Included are procedures and equipment for determining these criteria. For the purpose of this standard a commercial manufacturer is defined as one who produces ammunition by fabricating component parts from raw materials as opposed to remanufacture with parts originally made by others.

This standard for Centerfire Rifle Sporting Ammunition was first published in 1979 and periodically updated until this revision in 2015. Changes in the standard with each revision include minor adjustments of velocities, the addition of new load offerings, and updating of recommended equipment sources and the latest procedures for reporting reference ammunition assessments.

Suggestions for improvement of this standard will be welcome. They should be sent to: The Sporting Arms and Ammunition Manufacturers' Institute, Inc., Flintlock Ridge Office Center, 11 Mile Hill Road, Newtown, Connecticut 06470-2359.

Consensus for this standard was achieved by use of the Canvass Method.

The following individuals and organizations recognized as having an interest in the standardization of safety requirements for factory-loaded sporting ammunition were contacted prior to the approval of this standard. Inclusion in this list does not necessarily imply that the individual or organization concurred with the submittal of the standard to ANSI:

Aberdeen Proving Grounds – P. Donahue  
Association of Firearm and Toolmark Examiners – L. Haag  
Association of Firearm and Toolmark Examiners – J. Hamby, M.A.

## CARTRIDGES AND CHAMBERS FULL AND ABBREVIATED NAMES

The following list presents the recommended full names and abbreviated names of the centerfire rifle cartridges and chambers currently supplied for various types of firearms.

These full or abbreviated names should be used on cartridge headstamps and on firearm markings to properly identify the caliber.

### **ORDER OF LISTING**

Lists of centerfire rifle cartridges are arranged according to the following rules:

- 1) All Metric cartridges
  - a) First in ascending numerical order of approximate caliber designation,
  - b) Then in alphabetical order.
- 2) Followed by American cartridges
  - a) First in ascending numerical order of approximate caliber designation,
  - b) Then alphabetical order.
- 3) Within each of the above groups, cartridges are arranged in order of:
  - a) 2-digit numbers,
  - b) 2-digit numbers and a hyphen followed by more numbers,
  - c) 3-digit numbers.

For lists that present both cartridge name and several bullet weights, list in ascending numerical order of bullet weights.

## VELOCITY DATA INTERPRETATION

---

Velocity recommendations are stated on the basis of a nominal lot mean velocity as measured using equipment in accordance with the requirements of Section III and the procedures detailed in Section II. Due to the fact that sporting firearms for general distribution are typically manufactured to dimensional tolerances greater than those specified for test barrels, there should be no expectation that these velocities can be duplicated from any test utilizing firearms. This situation is further confounded by discrepancies in barrel length. Furthermore, once ammunition has left the control of the manufacturer, storage conditions outside those recommended by the manufacturer may cause variations in the velocity as measured using test equipment and procedures which conform to the requirements of this Standard.

The values presented on pages 11 through 34 are recommended values for the use of ammunition producers at the time of manufacture. It is the responsibility of the manufacturer to establish sample sizes, sampling frequencies, and tolerances to ensure the performance of the ammunition obtained by the ultimate user meets all applicable safety and functional standards. Of particular importance in establishing velocity tolerances is the understanding that velocities significantly higher than the nominal lot mean can cause actual maximum range performance to exceed expected values.

Ammunition tested subsequent to manufacture using equipment and procedures conforming to these guidelines can be expected to produce velocities within a tolerance of  $\pm 90$  fps of the tabulated values.

## **FACTORS AFFECTING PRESSURE MEASUREMENTS**

Two principal methods of measuring centerfire rifle pressures are recognized: the copper crusher method and the piezoelectric transducer method. One or the other may be used or they may be used simultaneously.

There are three principal factors affecting pressure measurements. These are instrumentation, ammunition and procedure. The following lists present the items in each category that may cause difficulties in testing carried out with the two methods.

### **I. FACTORS IN COPPER CRUSHER TESTING**

#### **INSTRUMENTATION**

1. Condition of test barrel (whether minimum or maximum bore, chamber size and headspace, amount of erosion at throat and bore).
2. Diameter of piston and piston hole.
3. Fit of piston in piston hole.
4. Location of piston hole.
5. Tightness of barrel mounting in Universal Receiver, if used.
6. Shape, size and protrusion of firing pin beyond breech face.
7. Force of firing pin blow.
8. Size, material and characteristics of the pressure-sensitive element of the gauge (copper crusher cylinders).
9. Type, size and condition of gas check.
10. Type of piston and gas check lubricant.
11. Quality and tolerance of piston hole gauges and headspace gauges.
12. Quality of crusher measuring instrument.

#### **AMMUNITION**

1. Condition of cartridge.
2. Position of powder in cartridge case.
3. Temperature of ammunition.

#### **PROCEDURE**

1. Failure to mount pressure barrel properly in Universal Receiver or other test action to assure minimum headspace.
2. Failure to rotate cartridge and close breech carefully to assure proper powder positioning.
3. Failure to wipe piston ends, crusher and setscrew face to remove excess oil.
4. Failure to center crusher cylinder on piston and properly adjust setscrew.
5. Failure to fire warming shots.
6. Overheating barrel by excessive rate of fire.
7. Failure to clean bore and control metal fouling.
8. Failure to clear barrel of brass disk blanked from the case wall and gas check from previous shot.

## **II. FACTORS IN PIEZOELECTRIC TRANSDUCER TESTING**

### **INSTRUMENTATION**

1. Condition of test barrel (whether minimum or maximum bore, chamber size and headspace, amount of erosion at throat and bore).
2. Fit of transducer in barrel.
3. Location of transducer.
4. Tightness of barrel mounting in Universal Receiver, if used.
5. Shape, size and protrusion of firing pin beyond breech face.
6. Force of firing pin blow.
7. Characteristics of the transducer.
8. Quality of the transducer.
9. Quality of the read-out system.

### **AMMUNITION**

1. Condition of cartridge.
2. Position of powder in cartridge case.
3. Temperature of ammunition.

### **PROCEDURE**

1. Failure to mount pressure barrel properly in Universal Receiver or other test action to assure minimum headspace.
2. Failure to rotate cartridge and close breech carefully to assure proper powder positioning.
3. Failure to fire warming shots.
4. Overheating barrel by excessive rate of fire.
5. Failure to clean bore and control metal fouling.
6. Failure to protect transducer against contamination, such as oil or water.
7. Transducer calibration.
8. Read-out system calibration.

## EXPLANATION OF PRESSURE TERMINOLOGY

The SAAMI Pressure data outlined in this section is based on a Maximum Average Pressure (MAP) for each cartridge and a Coefficient of Variation of 4%. The Coefficient of Variation (CV) of 4% was based on the CV that exists for the 50,000 psi pressure level and is calculated by dividing the population standard deviation ( $\sigma = 2,000$  psi) by the Maximum Average Pressure (MAP = 50,000 psi) which equals 0.04 (4%). All other pressure terminology is derived directly from these two terms.

SAAMI recognizes two pressure-measuring systems. The preferred system is the piezoelectric transducer system with the transducer flush-mounted in the chamber of the test barrel. Pressure developed by the burning propellant exerts force on the transducer through the cartridge case wall causing the transducer to deflect, creating a measurable electric charge. Pressures measured with this system are expressed in units of "pounds per square inch" (abbreviated psi).

The second, older system employs a copper crusher cylinder which is compressed by a piston fitted to a piston hole into the chamber of the test barrel. Pressure generated by the burning propellant acts on the base of the piston forcing the piston to move, thereby permanently compressing the copper cylinder. Pressures measured by this system are expressed in "Copper Units of Pressure" (abbreviated as CUP).

Throughout the following text the pressure is expressed in terms of "pounds per square inch" (psi) however, it should be understood that the same procedures apply to pressures expressed in "Copper Units of Pressure" (CUP).

Maximum Average Pressure - is the recommended maximum pressure level for loading commercial sporting ammunition.

Standard Deviation ( $\sigma$ ) - The Standard Deviation for each Maximum Average Pressure level is based on a Coefficient of Variation of 4%. This 4% Coefficient of Variation is maintained throughout the SAAMI pressure spectrum providing a realistic Standard Deviation for each pressure level. To obtain the Standard Deviation for a particular MAP, multiply the MAP by 0.04 (i.e., 50,000 psi x 0.04 = 2,000 psi).

Standard Error ( $\sigma_x$ ) - The standard error is calculated by dividing the Standard Deviation (population S. D. =  $\sigma$ ) by the square root of the sample size  $\sigma_x = \sigma / \sqrt{n}$

Maximum Probable Lot Mean (MPLM) - The MPLM is calculated by adding two standard errors to the Maximum Average Pressure in order to assure there is a 97.5% probability that the Maximum Probable Lot Mean pressure is not exceeded. See Figure 1.

The SAAMI pressures are calculated based on a sample size of ten (10). The Maximum Probable Lot Mean represents the midpoint of the upper service pressure distribution. See Figure 1. For example, if the Maximum Average Pressure is 50,000 psi, the Maximum Probable Lot Mean (MPLM) is calculated as follows:

$$\text{MPLM} = \text{Maximum Average Pressure} + 2 \text{ standard errors}$$

$$\text{MPLM} = 50,000 \text{ psi} + [(50,000 \text{ psi} \times 0.04) / \sqrt{10}] \times 2$$

$$\text{MPLM} = 50,000 \text{ psi} + (633 \text{ psi} \times 2) = 50,000 \text{ psi} + 1266 \text{ psi} = 51,266 \text{ psi rounded to } 51,300 \text{ psi}$$

Maximum Probable Sample Mean (MPSM) - is the maximum expected average pressure that may be observed in the testing of product subsequent to its manufacture and is not intended for use as a loading control point. The Maximum Probable Sample Mean is positioned three (3) standard errors above the Maximum Probable Lot Mean i.e.,  $\text{MPLM} + 3 \sigma_{\bar{x}}$ . See Figure 1. The Maximum Probable Sample Mean defined here is the value previously referred to in the ANSI/SAAMI Standards as the Maximum Product Average.

**Figure 1**

Maximum Extreme Variation - The maximum allowable sample E.V. (Extreme Variation or Range) is a statistic derived from the knowledge of the population Standard Deviation. Applying table figures from the Relative Range Tables (Biometrika Tables for Statisticians) we calculate the Maximum E.V. or Range as (population  $\sigma$ ) x 5.16 (table constant for sample of 10 at 99.0% confidence level) i.e.,  $2,000 \text{ psi} \times 5.16 = 10,320 \text{ psi rounded down to } 10,300 \text{ psi}$ .

---

## **EXPLANATION OF PRESSURE MEASURING SYSTEMS**

---

The two SAAMI-recognized pressure-measuring systems for centerfire rifle cartridges are the copper crusher system and the piezoelectric transducer system.

A brief explanation of these two systems follows:

### **COPPER CRUSHER SYSTEM**

This system employs a copper crusher cylinder that is compressed by a piston fitted to a piston hole into the chamber of the test barrel. The pressure developed by the gases from the burning propellant acts through the piston hole, allowing the gases to force the piston upward, and thereby permanently compressing the copper crusher cylinder. The Sporting Arms and Ammunition Manufacturers' Institute has adopted the pressure units designation of "Copper Units of Pressure" (abbreviated CUP) for this system. This designation applies only to values obtained using the particular crushers, target tables and methods outlined in this Standard.

### **PIEZOELECTRIC TRANSDUCER SYSTEM**

This system employs a piezoelectric transducer flush mounted in the chamber of the test barrel. Pressure developed by the gases from the burning propellant exerts force on the transducer through the cartridge case wall causing the transducer to deflect, creating a measurable electric charge. This electrical charge is converted into a reading of pressure.

The Sporting Arms and Ammunition Manufacturers' Institute has adopted the pressure units designation of "pounds per square inch" (abbreviated psi) for this system. This designation applies to values obtained with transducers and methods as outlined in this Standard.

## BULLET TYPE ABBREVIATIONS

---

### **LEAD:**

HP .....Hollow Point  
L .....Lead  
LHP .....Lead Hollow Point  
MP .....Metal Point

### **JACKETED:**

BT .....Boat Tail  
BTHP .....Boat Tail Hollow Point  
FP .....Flat Point  
FMJ .....Full Metal Jacket  
FMC .....Full Metal Case  
HP .....Hollow Point  
JF .....Jacketed Frangible  
JFP .....Jacketed Flat Point  
JHP .....Jacketed Hollow Point  
JSP .....Jacketed Soft Point  
MC .....Metal Case  
OTM .....Open Tip Match  
P .....Partition  
PHP .....Plated Hollow Point  
PSP .....Pointed Soft Point  
PT .....Polymer Tip  
S .....Spitzer  
SP .....Soft Point  
XP .....eXpanding Point

### **SEMI-JACKETED:**

SJHP .....Semi-Jacketed Hollow Point  
SJSP .....Semi-Jacketed Soft Point

### **OTHER:**

HC .....Hard Cast  
Solid .....Indicates a bullet constructed of a single material other than lead.

NOTE: The abbreviations presented here are those which are generic indications of construction features of a projectile. Abbreviations indicative of a specific manufacturer's brand or trademarked name are beyond the scope of this table.

## TOLERANCE – BULLET WEIGHT

---

### **1. Lead and lead-core bullets:**

Less than 100 grains..... Nominal weight  $\pm 2.0\%$

Equal to or greater than 100 grains ..... Nominal weight  $\pm 1.5\%$

### **2. Bullets of principally non-lead construction:**

All bullet weights..... Nominal weight  $\pm 3.0\%$

---

## PROCEDURE: VELOCITY & PRESSURE TESTING

---

### I. SCOPE

- A. This procedure covers the testing of ammunition for assessment of velocity and pressure using either the copper crusher method of pressure measurement or with piezoelectric pressure transducers (“transducers”).

---

### II. GENERAL

- A. When testing using copper crushers, velocities and pressures are measured separately. Velocity measurements should be made using a test barrel fitted with long pistons or velocity barrels (without piston holes). Pressure measurements should be made using test barrels fitted with short pistons and gas checks. Velocities observed during pressure testing with short pistons should be recorded for information.
- B. When testing using transducers, velocities and pressures are measured simultaneously.
- C. Recommended values for velocity and pressure of all centerfire rifle cartridges are tabulated in Section I. When required, a retest of double the original quantity may be fired with statistically equivalent tolerances.
- D. Velocities and pressures should be measured using horizontally-mounted test barrels in accordance with the drawings and descriptions listed in Section III.

---

### III. EQUIPMENT

#### A. COMMON

<u>Item</u>	<u>Type</u>	<u>Alternate</u>
1. Universal receiver	“Frankford Arsenal”	or equivalent
2. Photoelectric screens	Oehler Model 55 or 57	or equivalent
3. Ballistic measurement system	Oehler Model 85	or equivalent

#### B. COPPER CRUSHER TESTING

<u>Item</u>	<u>Type</u>	<u>Alternate</u>
1. Test barrel	Piston type	Velocity barrel may be used in place of long piston measurements
2. Pistons	Short	- - -
3. Gas Checks	0.206”, oiled	- - -
4. Copper crushers	.146” x .400” or .225” x .400” as needed	- - -
5. Micrometer	Capable of measuring to 0.0005”	- - -
6. Tarage table	Specific for lot of crushers in use	- - -

#### C. TRANSDUCER TESTING

<u>Item</u>	<u>Type</u>	<u>Alternate</u>
1. Charge Amplifier	PCB, Model 443B02	or equivalent
2. Voltmeter, Peak Capture	PCB, Model 444A152	or equivalent
3. Transducer	PCB, Model 117BXXX	or equivalent
4. Low Noise Cable	PCB, Model 003AXXX	or equivalent

5. Integrated Data  
Acquisition System

Oehler Research, Inc.,  
System 85

or equivalent

#### IV. HANDLING OF AMMUNITION

- A. Cartridges to be tested should be placed in a vertical position with primer-end down in a recessed holding block.
- B. When the appropriate test barrel has been properly serviced and the chronograph reset, a cartridge should be lifted vertically from the block. It should be rotated slowly, end over end, in a vertical plane through 360° pausing momentarily when the powder is at the bullet end and again when the powder is at the primer end.
- C. The cartridge is then rotated slowly, a minimum amount to enter the chamber, keeping the primer end in the lowest possible position until inserted gently and carefully into the chamber.
- D. The cartridge should be seated in the chamber as far as practicable with the fingers. The bolt or breech mechanism should be closed gently in order not to disturb the position of the powder in the cartridge case. The object of this method of handling cartridges is to position the propellant powder at the primer end of the cartridge case by permitting it to fall gently against the primer while rotating the case.
- E. The rate of fire should not be rapid enough to cause excessive heating of the barrel. The time between rounds depends on the equipment, as the barrel may be cooled by a constant stream of air on the outside or by directing air through the bore after each ten rounds.
- F. Ammunition conditioning should be between 60° - 80°F (15.6° - 26.7°C).
- G. A minimum of one and up to three warming shots should be fired before firing each series for record. The velocity and/or pressure of these shots may be recorded, but should not be included in the record of the sample.

#### V. PRESSURE DETERMINATION

##### A. COPPER CRUSHER TESTING

1. Oiling of the gas check is extremely important as a poor gas seal will cause erosion of the piston hole and piston causing erroneous readings before the barrel bore and chamber are worn out. Use SAE 30 oil (see Section III). Gas checks should be placed in a shallow container of oil. Each gas check is then blotted on absorbent material before insertion in the piston hole.
2. Insert oiled gas check with open end toward the chamber into the piston hole and seat to approximately one-half of the depth of the hole with the seating tool (see Section III).
3. Dip piston shank in oil and drain until but one drop of oil remains. Scrape the remaining drop from the bottom of the piston or blot remaining oil on a flannel patch.
4. Insert piston in piston hole and seat on gas check manually. Do not force by striking or hammering.

**CAUTION:** The piston must be checked to make sure it slides freely, but not loosely, in the piston hole at all times. If the piston does not slide freely, it should be withdrawn from the piston hole and examined. Any black deposits should be removed with worn crocus cloth. If the piston is still not free in the piston hole, the hole should be cleaned with worn crocus cloth.

5. Insert cartridge to be tested in chamber of standard velocity and pressure test barrel in the manner described in paragraphs IV(B) through IV(D), above.
6. Using finger pressure, push the piston down into the piston hole until the piston/gas check is fully seated.
7. Center crusher cylinder appropriate for the cartridge under test upon the head of the piston. Slide the anvil bridge so as to center it over the crusher/piston and securely tighten the set screws on the bridge. Gently tighten the anvil against the crusher cylinder using light finger pressure.

**CAUTION:** Overtightening the anvil can cause precompression of the crusher cylinder and affect the subsequent pressure reading. Use care to not over-tighten the anvil.

**CAUTION:** The face of the piston head, face of set screw and faces of crusher must be free from oil.

8. The breech mechanism should be closed gently.
9. After firing the cartridge, the compressed crusher cylinder should be removed and measured for remaining length. Pressure is determined from this length by the use of the Tarage Table, furnished with the cylinders, for the piston diameter used.
10. The piston is removed and the gas check and the disk blanked from the cartridge case by internal gas pressure is removed after each shot by driving the gas check downward with the knockout tool (see Section III) into the fired cartridge case.
11. The fired cartridge case containing the gas check and disk blanked from the cartridge case is removed from the chamber.

**CAUTION:** The chamber and bore should be checked to make certain that the barrel is unobstructed before proceeding further.

12. For subsequent shots in a series, the procedure shown in paragraphs V(A)(1) through V(A)(10) are repeated.

## ***B. PIEZO-ELECTRIC TRANSDUCER TESTING***

### ***1. EQUIPMENT PREPARATION***

- 1.1 Refer to the SAAMI-recommended piezo pressure transducer installation in a pressure barrel illustrated in Section III.
- 1.2 The charge amplifier and peak capture voltmeter should have a certified calibration traceable to the National Institute of Standards and Technology.

## 2. INITIAL SET-UP

- 2.1 Turn on the electronic equipment and allow to stabilize as recommended by the manufacturer.
- 2.2 Inspect the transducer mounting cavity in the pressure barrel to assure that the seal seat is free of dirt and any other foreign matter.
- 2.3 Mount transducer with steel spacer rings into the test barrel as described in PCB Operating Instructions Manual.
- 2.4 Loosen, but do not remove, the slotted clamp.
- 2.5 Thread the transducer into the mounting port. Adjust the slotted clamp to allow guide pin to enter guide hole. Continue to turn transducer nut into the mounting port. When transducer bottoms, tighten the slotted clamp and torque the transducer as recommended by the manufacturer.
- 2.6 It is essential that the sensing surface of the transducer be flush with the chamber inside diameter. Care must be exercised to obtain correct depth as well as exact rotational alignment. Depth adjustment is accomplished by the use of various thickness spacers. In order to set the depth exactly it may be necessary to hone the spacers to the desired thickness.
- 2.7 Connect equipment as shown in on page 178

a. **NOTE:** Configurations 1 and 2 are interchangeable.

**IMPORTANT:** Always switch the amplifier to the “zero lock” mode by pressing the “ZERO” button before making connections to the Model 443B02, and allow switch to remain in this position during such connections. This protects the FET input stage against possible gate damage from excessive accumulated static charge.

- 2.8 Set the charge amplifier controls for short time constant, transducer sensitivity to the slope (m) obtained from the transducer least square line equation, output sensitivity to 0.100 mV/unit, and set the amplifier to operating mode (releasing the “zero lock” by pressing the “ZERO” button a second time).
- 2.9 Select digital peak meter, positive input, peak mode, and 10-volt range.
- 2.10 Take note of the transducer offset value (P) obtained from the least square line equation. This value will be used later in making final peak pressure determination.
  - (a) The offset value may also be dialed into an instrumentation system capable of providing direct peak pressures without data manipulation.

## 3. PROCEDURE

- 3.1 Reset all pressure instrumentation and assure that the peak meter digital display reads all zeros. Test rounds may now be fired.
- 3.2 For each round fired, the pressure reading on the digital display should be recorded and pressure instrumentation reset.

## 4. PEAK PRESSURE DETERMINATION

- 4.1 To determine peak pressures, add as required, the pressure offset value to the pressure readings obtained in the firing test. Adding the offset value is not required if it is dialed in on the peak meter.

---

## VI. VELOCITY DETERMINATION

- A. Handling of the ammunition should be in accordance with the instructions in paragraph IV.
- B. Photoelectric screens should be arranged in accordance with the arrangement shown on page 224, “*Equipment: Schematic Layout of Velocity Screens*”.
- C. A table of time of flight vs. velocity should be used to determine instrumental velocity at 15 feet (4.57 m), nominal, from the gun muzzle (not required when using direct reading equipment).
- D. It is recommended that a blast shield be positioned between the muzzle of the Universal Receiver test barrel and the first velocity screen to minimize possibility of premature triggering of the velocity screens. With velocities below the speed of sound, the muzzle blast and/or muzzle flash will reach the screen before the bullet and may cause premature triggering of the screen. For example, premature triggering of the first screen will result in abnormally low velocity readings. Premature triggering of both screens will result in velocity readings which correspond to the speed of sound (approximately 1,120 fps at sea level and normal atmospheric conditions).
  - (i) The blast shield should be made of rigid, opaque material of sufficient strength to withstand the shock wave but not be resistant to the passage of the projectile.

---

## VII. RECORDING OF TEST RESULTS

- A. The following data should be recorded for each series of shots fired for velocity and pressure.
  - 1. Ammunition Data
    - 1.1 Date of test
    - 1.2 Nominal cartridge identification
    - 1.3 Cartridge caliber
    - 1.4 Bullet weight and type
    - 1.5 Powder charge, type, and lot
    - 1.6 Priming
    - 1.7 Type of lubricant (if any)
    - 1.8 Code or date of loading
  - 2. Average velocity, uncorrected.
  - 3. Average pressure, uncorrected.
  - 4. Maximum and minimum individual velocity.
  - 5. Maximum and minimum individual pressure.
  - 6. Extreme variation (range) of velocity.
  - 7. Extreme variation (range) of pressure.
  - 8. Other statistical indication of variation (optional).
  - 9. Correction to results from firing Reference Ammunition (optional).
  - 10. Corrected average velocity (optional).
  - 11. Corrected average pressure (optional).
  - 12. Recommended values
    - 12.1 Average velocity

- 12.2 Average pressure
  - 12.3 Velocity and pressure variation
  - 13. Test firearm and range data
    - 13.1 Barrel length and serial number
    - 13.2 Barrel history
    - 13.3 Transducer serial number / copper crusher lot number
    - 13.4 Type of chronograph and screens
  - 14. Test personnel.
- 

## **VIII. USE OF REFERENCE AMMUNITION**

- A. Purpose
    - 1. Reference ammunition, assessed by firings at the ranges of member companies, is available for calibrating ranges, firearms and other equipment for velocity and pressure only.
  - B. Supply
    - 1. On request, the SAAMI Technical Office<sup>1</sup> will supply information on the manufacturer of specific Reference Ammunition. The method of identifying Reference Ammunition is shown in Section II.
    - 2. Requests for Reference Ammunition should be addressed to the manufacturer of the specific cartridge.
  - C. Assessment
    - 1. Details of the assessment tests are shown in Section II.
  - D. Clearing House
    - 1. Results of assessment tests of Reference Ammunition are tabulated, analyzed and distributed by the SAAMI Technical Office.
  - E. Corrections
    - 1. For method of applying corrections to tests of service loads see Section II.
  - F. Calibration
    - 1. For method of calibrating ranges and equipment, see Section II.
- 

## **IX. TEST BARREL CLEANING**

- A. Test barrels should be cleaned regularly using solvents, brushes and/or other equipment as dictated by the type and severity of fouling in the test barrel.

---

<sup>1</sup> Refer to Section III – page 223 for current contact information for the SAAMI Technical Office.

---

## **VELOCITY & PRESSURE BARRELS: QUALIFICATION**

---

All barrels are not necessarily suitable for use in determining pressure or velocity levels, even though they may conform to the dimensions given on the appropriate Standard Velocity and Pressure Barrel drawing in this Standard. New barrels may require a number of rounds to be fired to remove sharp corners or burrs resulting from the manufacturing process. Barrels in service do not have an unlimited life and may become unserviceable from wear and erosion. There is no predictable number of rounds to which a barrel should be exposed before use for pressure and velocity determinations, nor is there a predictable round life for such equipment.

The following procedure is suggested for determining the suitability of any barrel for pressure and velocity test use:

Fire ten rounds of SAAMI Reference Ammunition following the procedures as shown in this Standard. The average velocity and pressure results of the test should be within the Inclusion Limits as given on the latest assessment of the lot fired.

In the case of a new barrel, the firing of more breaking-in shots may be indicated after which the Reference Ammunition test should be repeated.

In the case of barrels which have been in service, refurbishing of the piston and piston hole, removal of fouling, or other corrective procedures may be implemented followed by a retest.

---

## **VELOCITY & PRESSURE BARRELS: MOUNTING IN RECEIVERS**

---

It is essential that close headspace be maintained in velocity-pressure testing equipment if reliable test results are to be achieved.

In mounting test barrels to Universal Receivers or test actions, a headspace not exceeding 0.003” (0.07 mm) over minimum should be maintained. This may be measured by headspace gauges, shim stock or feeler gauges, or a combination thereof whichever is most appropriate for the type of equipment being used.

Headspace adjustments with the Universal Receiver may be accomplished by several methods:

1. Formed shim stock behind the firing-pin plate.
2. Formed shim stock on the rear bearing shoulder of the Barrel Collar.
3. Adjustment of the Breech Block Locking Screws.

---

**PROCEDURE:**  
**USE OF PISTON HOLE GAUGES**

---

Pressure barrel piston hole size should be checked periodically with piston hole gauges to determine whether or not erosion is present. Piston hole erosion can cause high or erratic pressure readings and low velocity readings.

Three piston hole gauges for each piston hole size (0.146" diameter, 0.206" diameter) constitute a set: 1) plug gauge, 2) longitudinal gauge and, 3) transverse gauge. Each gauge is double-sided, "go" and "no go". The gauges are used as described below:

1. Attempt to insert the appropriate "no go" plug gauge into the top of the piston hole.
2. Insert the appropriate "no go" longitudinal gauge through the chamber, align it with the bottom of the piston hole, and attempt to insert the gauge upward into the hole.
3. Attempt to insert the appropriate "no go" transverse gauge into the bottom of the piston hole in the same manner as described above for the longitudinal gauge.
4. If the piston hole accepts any of the "no go" gauges, the hole diameter is larger than the maximum acceptable.

The probable cause of extreme piston hole erosion is poor gas sealing (improper use of gas checks and/or insufficient oiling).

In some cases, minor erosion does not seem to affect pressure and velocity readings. An analysis of test results will indicate whether or not repair is necessary.

## PROCEDURE: PIEZOELECTRIC TRANSDUCER CALIBRATION

### I. SCOPE

- A. This procedure covers the calibration of piezoelectric pressure transducers (“transducers”) for use in the measurement of ballistic pressures.

### II. TEST EQUIPMENT

A.	<u>ITEM</u>	<u>TYPE</u>	<u>ALTERNATE</u>
1.	Digital Voltmeter	Fluke, Model 8440	or equivalent
2.	Charge Amplifier	PCB, Model 443B02	or equivalent
3.	Transducer Calibrator (Direct fluidic calibrator)	PCB Group; The Modal Shop, Inc., Model K9905D	or equivalent
4.	Insulation Tester	Kistler, Model 5491	or equivalent
5.	Transducer	PCB, Model 117BXXX	or equivalent
6.	Low Noise Cable	PCB, Model 003CXX	or equivalent
7.	Calibration Adapter	PCB, Model 090B Series	or equivalent

### III. EQUIPMENT PREPARATION

- A. All instruments should be operational and calibrated per manufacturer specification.
- B. The transducer calibrator and instruments used to calibrate the charge amplifier and digital voltmeter should have a certified calibration traceable to the National Institute of Standards and Technology.
- C. Transducers should be properly maintained per manufacturer recommendations or stored in a desiccator when not in use.

**CAUTION:** When not in use, the cable, transducers, and instrument connectors should be stored with plastic caps to prevent contamination.

- D. Measure the internal resistance of the transducer and low noise cable. If the resistance is less than  $10^{12}$  ohms, follow the steps detailed in paragraph IV(B), Transducer Initialization. If the resistance is in the  $10^{12}$  to  $10^{14}$  ohm range, proceed to paragraph V, Transducer Calibration.

### IV. TRANSDUCER INITIALIZATION

- A. Clean transducer and low noise cable connectors using an acceptable solvent per the manufacturer’s recommendations.
- B. Bake-out transducer and low noise cable in a temperature controlled oven for 24 to 48 hours at 250°F (121°C).
- C. Allow oven to return to ambient temperature at a slow rate.
- D. After removing the transducer and cable from the oven, check the internal resistance of the transducer. The resistance should be in the  $10^{12}$  to  $10^{14}$  ohm range.
- E. Place protective caps on transducer and cable connectors to prevent contamination.

## **V. TRANSDUCER CALIBRATION**

### **A. INITIAL SET-UP**

1. Turn on the electronic equipment and allow it to stabilize as recommended by the manufacturer.
2. Inspect the transducer mounting cavity to assure that the seal seat is free of dirt and any other foreign matter.
3. Mount transducer with steel spacer rings into calibration fixture as described in PCB Operating Instructions Manual.
4. Loosen, but do not remove, the slotted clamp.
5. Thread the transducer into the mounting port. Adjust the slotted clamp to allow guide pin to enter guide hole. Continue to turn transducer nut into the mounting port. When transducer bottoms, tighten the slotted clamp and torque the transducer as recommended by the manufacturer.
6. It is essential that the sensing surface of the transducer be flush with the chamber inside diameter. Care must be exercised to obtain correct depth as well as exact rotational alignment. Depth adjustment is accomplished by the use of various thickness spacers. In order to set the depth exactly it may be necessary to hone the spacers to the desired thickness.
7. Mount calibration adapter with transducer on the calibrator.
8. Insert the cartridge case with an inert or fired primer into calibration adapter and complete fixture assembly as per PCB instruction manual. If the sample cartridge is a loaded round, it may be disassembled, the powder removed, and the primer in the empty case then fired. An optional procedure is to deprime the case and use the O-ring/plug seal shown in Section III – page 228. Cycle this case to the appropriate maximum pressure in order to “seat” the transducer.
9. Connect transducer and instrumentation as indicated in Figure 2 on page 175.
10. Set the charge amplifier sensitivity to 0.999 and set the time constant switch to LONG.
11. Set DVM to 10-volt range.

### **B. CALIBRATION**

1. Adjust pressure readout indicator of the transducer calibrator to 0 psi with no pressure on hydraulic lines.
2. Insert a new cartridge case.
3. Reset charge amplifier and digital voltmeter (DVM) to obtain zero volts output.
4. Apply pressure in increments as indicated in Section II – pages 170-174. Calibration pressure range should cover the pressure ranges shown in Section II – pages 170-174. DO NOT exceed the maximum pressure established by the manufacturer for the fixture.
5. Record DVM reading after the pressure readout indicator is exactly at desired pressure level. Do not release the pressure until the highest pressure level, for the cartridge under test, has been reached. Read the pressure at each increment. Do not overshoot the pressure points!
6. After reaching the highest calibration pressure level, release the pressure slowly.
7. Replace the cartridge case in calibration adapter.
8. Repeat steps 1 through 7 until a minimum of ten valid data points are obtained.

**CAUTION:** Always **INCREASE** pressure to desired level, never decrease pressure to desired level.

9. Transducers need to be re-calibrated when changing brands of ammunition or if there have been changes in cartridge case processes and/or material.

### **C. DATA REDUCTION**

1. Calculate the average value for the output voltages recorded at each pressure increment. Multiply these average values by the charge amplifier sensitivity (pC/V) to obtain the transducer charge output (Q) at these pressure increments (P).
2. Obtain a least square line equation using the transducer charge output (Q) as the dependent variable and pressure (P) as the independent variable.  $Q = mP \pm q$ .
3. A manual method of calculating the least square line equation is given in tabular form in Section II – page 176. It is recommended that when using this technique, all numbers be carried to the third decimal place.
4. Obtain the pressure (P) offset value when Q in the line equation is zero. Refer to Figure 4, page 177.

---

## **VI. CALIBRATION CHECK**

- A. When the calibration calculations are complete, the sensitivity should be set on the charge amplifier. The digital voltmeter is set at zero. A new sample cartridge case is put in the calibration fixture and the hydraulic pressure increased to the highest pressure reached in the calibration. The digital voltmeter reading plus the offset should equal the hydraulic gauge reading. Check calibration again by inserting a second cartridge case. As a guideline, these values should agree within  $\pm 1.5\%$  of the gauge reading. If the transducer does not meet this guideline then recheck the calculations and/or recalibrate.

---

## **VII. TRANSDUCER RECORDS**

- A. Date of calibration
- B. The number of rounds to which the transducer has been exposed during test firing.
- C. Calibration pressure (P), charge amplifier voltage output (V), and transducer charge output (Q).
- D. Charge amplifier sensitivity.
- E. Least square line equation.
- F. Pressure offset, and transducer sensitivity (slope = m).
- G. Transducer identification.
- H. Date of next calibration.

## TRANSDUCER CALIBRATION: INCREMENTS AND RANGES

The following increments and ranges are to be used for the calibration of transducers:

<b>Cartridge</b>	<b>MAP (psi/100)</b>	<b>Pressure Increments (psi)</b>	<b>Pressure Range (psi)</b>
6 x 45mm	550	5,000	35,000 – 60,000
6mm Remington	650	5,000	35,000 – 60,000
6.5 Creedmoor	620	5,000	35,000 – 60,000
6.5 Grendel	520	5,000	35,000 – 60,000
6.5x55 Swedish	510	5,000	35,000 – 60,000
6.8mm Remington SPC	550	5,000	35,000 – 60,000
7mm Mauser (7x57)	510	5,000	35,000 – 60,000
7mm Remington Magnum	610	5,000	35,000 – 60,000
7mm Remington Short Action Ultra Magnum	650	5,000	35,000 – 60,000
7mm Remington Ultra Magnum	650	5,000	35,000 – 60,000
7mm Shooting Times Westerner	650	5,000	35,000 – 60,000
7mm Weatherby Magnum	650	5,000	35,000 – 60,000
7mm Winchester Short Magnum	650	5,000	35,000 – 60,000
7mm-08 Remington	610	5,000	35,000 – 60,000
7 x 64 Brenneke	N/E <sup>(1)</sup>	N/E	N/E
7-30 Waters	450	5,000	25,000 – 50,000
7.62 x 39	450	5,000	25,000 – 50,000
8mm Mauser (8x57)	350	5,000	20,000 – 45,000
8mm Remington Magnum	650	5,000	35,000 – 60,000

## REFERENCE AMMUNITION: USE

---

### A. PURPOSE

Reference Ammunition is for the purpose of relating pressure and velocity test results at all ranges.

### B. PROCUREMENT

Reference Ammunition is procured as noted in Section III – page 221.

### C. USE

The use and usefulness of Reference Ammunition in connection with the testing of ammunition for velocity and pressure is predicated upon two basic assumptions as follows:

1. Associated with a given batch of Reference Ammunition at a given time is an assessed average velocity, an assessed average pressure, as well as upper and lower limits for each, which the averages of any ten round test may be expected to fall within when:
  - a. The reference ammunition manufacturer has applied appropriate safeguards to assure homogeneity of the lot.
  - b. The ammunition is tested only after being conditioned under controlled temperature and humidity.
  - c. The ammunition is tested in equipment compliant with Section III recommendations.
  - d. The ammunition is handled in strict accordance with Section II recommendations.
  - e. All auxiliary measuring equipment has been set up in accordance with Section II recommendations and is in proper working condition.
2. Although there will be changes over time in the velocity and pressure assessments, the changes occur sufficiently slowly to be detected by periodic reassessments before they have achieved a magnitude sufficient to impair the usefulness of the reference rounds. In other words, the velocity and pressure assessments are reasonably stable with time.

The average velocity and pressure that may be developed by a sample of Reference Ammunition in any given standard test barrel under given test conditions may be different from the results obtained under the test conditions referred to above in assumption 1 due to minor equipment variations and statistical sampling error. Such values may be perfectly real, providing the auxiliary equipment introduces no errors.

In order to realize the benefits of Reference Ammunition, some rules must be adhered to. Nevertheless, each individual user must make the final judgments concerning how often it is used and the use of the data. It is important, therefore, that there be a clear realization of what it can and what it cannot tell the ammunition tester.

Reference Ammunition cannot guarantee the absolute accuracy of any test system. It does, however, provide simple and direct data from any given ammunition test equipment to determine how closely it relates to the acceptable, average system as used by SAAMI members.

In line with the preceding discussion, the following recommendations are made for the use of Reference ammunition:

- A. Each Reference Lot should be conditioned before use.
- B. How often Reference Ammunition is used shall be determined by the user's internal practices, taking into account such factors as historical knowledge of barrel life.
- C. The recommended minimum sample shall be ten rounds.
- D. In the event the observed average velocity and pressure of the sample falls within the *Inclusion Limits*, a correction may or may not be applied according to the procedure given in Step G at the discretion of the user.
- E. If one average is outside of the *Inclusion Limits* and the other within, the average that exceeds the limits shall be corrected according to the procedure given in Step G.
- F. If both averages are outside of the *Inclusion Limits*, both the velocity and pressure shall be corrected according to the procedure in Step G.
- G. If the correction is to be applied, the correction shall be the difference between the assessed value and the observed average of the test.

---

## **REFERENCE AMMUNITION: SECONDARY REFERENCE AMMUNITION**

---

Occasionally, a test station will have a need for an inordinately large supply of Reference Ammunition in considerable excess to the usual volume. In order to minimize the premature exhaustion of any particular lot, it is suggested that the station create its own secondary reference lot to fill the special need.

A secondary reference lot should consist of a supply of off-the-shelf ammunition, each box bearing the same manufacturer's code name. The secondary reference lot should be approximately equivalent in bullet weight, average velocity, and average pressure to the Reference Ammunition that it replaces.

---

## REFERENCE AMMUNITION: NEW LOTS

---

### I. GENERAL

Reference Ammunition lots have been established for those lots or loads designated by the Technical Committee. Responsibility for production of each of the selected lots is assigned to a member company that is responsible for maintaining a supply. A five-year supply is recommended. It is desirable that Reference Ammunition be consistent with Standard values for that particular round.

When a producer has prepared a new lot, it shall be his responsibility to announce the lot to the SAAMI Technical Office<sup>6</sup>, giving a tentative assessment and other data. (An example of the recommended format for this announcement appears later in this section.)

The producer shall supply, at the time of the announcement of the new lot, to each member of the Reference Ammunition Group that has the capability to test that cartridge, one box of the new lot for immediate test. A current list of the testing capabilities of the Reference Ammunition Group is available from the SAAMI Technical Office on request.

The SAAMI Technical Office will announce the availability of the new lot to the participating ranges, giving the tentative assessment and other pertinent data. (An example of the recommended format for this announcement appears later in this section.)

### II. METHOD OF ASSESSMENT

Before announcing a new lot of reference ammunition to the SAAMI Technical Office, the manufacturer should make sufficient tests to determine Tentative Values of pressure and velocity for the new lot.

1. The test barrels shall conform to the SAAMI specifications for internal dimensions, length and piston / piezo gauge location. (Refer to Section III.)
2. Counter-chronographs and photoelectric screens shall be used in velocity measurements. (See Section III.)
3. Ammunition shall be conditioned for a minimum of 24 hours at  $70^{\circ} \pm 2^{\circ}\text{F}$  ( $21.1^{\circ} \pm 1.1^{\circ}\text{C}$ ) with relative humidity of  $60\% \pm 5\%$  before firing.
4. For copper crusher assessments, only an approved crusher lot shall be used in pressure measurements. (See Section III – page 195 for proper crusher sizes.)

---

<sup>6</sup> Refer to Section III - pages 223, for current contact information for the SAAMI Technical Office.

NEW REFERENCE LOT REPORTING FORM AND INSTRUCTIONS

These instructions pertain to the form shown in Section II, which is used for a Reference Ammunition producer to announce new lots to the SAAMI Technical Office, as well as for the SAAMI Technical Office to announce the new lot to participating ranges.

## REFERENCE AMMUNITION: PERIODIC ASSESSMENT

---

### I. PROCUREMENT

Reference ammunition is procured as noted in Section III.

### II. PERIODIC TESTS

#### A. STATIONS

1. All test conditions should conform as closely as possible to those prescribed in this Standard, and the following conditions should be met:
  - a) Tests should consist of ten (10) rounds for velocity and pressure fired during a single day.
  - b) Test barrels shall conform to SAAMI specifications for internal dimensions, length, and piston/transducer location.
  - c) Counter-chronographs and photoelectric screens (or equivalents) shall be used in velocity measurements. (See Section III.)
  - d) Ammunition shall be conditioned for 72 hours at  $70^{\circ} \pm 2^{\circ}\text{F}$  ( $21.1^{\circ} \pm 1.1^{\circ}\text{C}$ ) with relative humidity of  $60\% \pm 5\%$  before firing.
  - e) Only an approved crusher lot and/or transducer shall be used in pressure measurements. (See Section III, page 195 for proper crusher sizes.)
2. Each station should report results of its firing in the test on approved forms to the SAAMI Technical Office<sup>1</sup>. A sample of this report form is presented later in this subsection.

#### B. CLEARING HOUSE

1. The SAAMI Technical Office serves as the clearinghouse for all Reference Ammunition ballistics and related information. It shall be the responsibility of the SAAMI Technical Office to schedule testing and to assemble and distribute results of periodic tests. This should be done on the proper Reference Ammunition report form. (Sample, Section II)
2. The Reference Ammunition Report shall contain the average pressure, velocity, and related standard deviations as reported by each station for that lot. From this data, the SAAMI Technical Office will calculate and report the Raw Average, Corrected Average, and Inclusion Limits.
3. To obtain the Raw Averages, the SAAMI Technical Office shall include the 10-round averages for the pressure and velocity of all reporting stations and the first and second previous assessment value. If the 10-round average from any station

---

<sup>1</sup> Refer to Section III – page 223 for current contact information for the SAAMI Technical Office.

varies from the Raw Average by more than plus or minus 50 fps in velocity OR plus or minus 3,500 CUP/psi in pressure, the pressure or velocity data from that (those) station(s) should be discarded. The mean pressure and velocity data should be recalculated omitting the discarded data. The new mean is the “Corrected Average”. If the mean pressure value of a station is outside of the limits as defined above, but the velocity is in, the pressure data should be dropped and the velocity data retained. The converse is true as well. Using the Corrected Averages, the Inclusion Limits are determined as follows:

VELOCITY:    MEAN = Same as Corrected Average

HIGH = MEAN + 50 fps

LOW = MEAN – 50 fps

PRESSURE:    MEAN = Same as Corrected Average

HIGH = MEAN + 3,500 CUP/psi

LOW = MEAN – 3,500 CUP/psi

8. Oil, SAE 30
9. Gas check (Section III)
10. Gas check tools – seating and knockout (Section III)
11. Copper crushers
  - 0.146" x 0.400"
  - 0.225" x 0.400"Manufactured (Section III)  
Winchester Division, Olin Corporation.
12. Tarage table (supplied with each lot of purchased crushers; see Section III, pages 196-197 for sample tables)

0.146" x 0.400" when used with 0.146" piston  
0.146" x 0.400" when used with 0.206" piston  
0.225" x 0.400" when used with 0.206" piston

13. Measuring device for compressed crushers

- a) Micrometer, 1" capacity, minimum, 0.0005" precision.
- b) Platform dial indicator, 1" capacity, minimum, 0.0005" precision.
- c) Other device capable of measuring lengths up to 0.500" with a minimum precision of 0.0005"

14. Reference ammunition. (Refer to Section III – page 221 for supply sources.)

## EQUIPMENT: VELOCITY & CONFORMAL PIEZOELECTRIC PRESSURE TESTING

**NOTE:** Refer to Section III – page 223, *Supplier Contact Information*, for detailed information on contacting the manufacturers of listed products and the SAAMI Technical Office.

1. Electronic Counter Chronograph – 100 kilohertz, minimum
  - a) Oehler Research
  - b) Electronic Counters, Inc
  - c) Other equivalent.

2. Table of velocity vs. time of flight or electronic calculator.

**NOTE:** Items (1) and (2) may be replaced by a direct-reading velocity chronograph or integrated ballistic instrumentation system with equivalent accuracy and precision.

3. Photoelectric screens
  - a) Oehler Research
  - b) Electronic Counters, Inc.
  - c) Other equivalent.
4. Universal Receiver
  - a) Ulysses Machine Company
  - b) H-S Precision, Inc.
  - c) Other equivalent.
5. Test Barrel (Drawings of test barrels are presented in Section III).
  - a) H-S Precision, Inc.
  - b) Wiseman
  - c) Wilson Arms Company
  - d) Hart Rifle Barrels, Inc.
  - e) Krieger Barrels, Inc.
  - f) Or equivalent.
6. Digital voltmeter
  - a) Fluke model 8440
  - b) Other equivalent
7. Charge amplifier with 20KHz low pass filter
  - a) PCB Piezotronics, Inc. model 443B02
  - b) Other equivalent
8. Peak meter
  - a) PCB Piezotronics, Inc. model 444A152
  - b) Other equivalent

NOTE: Items (6) and (8) or (6), (7), and (8) may be replaced by an integrated ballistic instrumentation system of equivalent accuracy and precision.

9. Piezoelectric transducer

- a) PCB Piezotronics, Inc. model 117Bxx
- b) Other equivalent

10. Low noise cable

- a) PCB Piezotronics, Inc. model 003Cxx
- b) Other equivalent

11. Transducer calibrator

- a) PCB Group; The Modal Shop, Inc.; Model K9905D
- b) Other equivalent

12. Calibration adapter

- a) PCB Piezotronics, Inc. model 090B series
- b) Other equivalent

13. Reference ammunition

Refer to Section III – page 221 for supply sources.

## USAGE OF CRUSHER CYLINDERS IN PRESSURE TESTING

Copper crusher cylinders manufactured and qualified in accordance with SAAMI guidelines and of the nominal sizes listed below shall be used for pressure tests of centerfire rifle cartridges.

Crusher cylinders shall not be pre-compressed before use.

Sample tarage tables are shown on pages 196 and 197 for illustrative purposes; only the tarage table furnished with the particular lot of cylinders should be used.

Designation	Nominal Size	PISTON		Average Pressure Limits  (CUP/100)
		Diameter	Area	
A	0.146" x 0.400"	0.206"	1/30 inch <sup>2</sup>	Less than 240
C	0.225" x 0.400"	0.206"	1/30 inch <sup>2</sup>	240 and greater

It is recommended that pressures be recorded in "Copper Units of Pressure", or "CUP".\*

\* - The designation "Copper Units of Pressure" ("CUP") was adopted by the Technical Committee at their meeting of January 8, 1969, to replace the previous designation of "pounds per square inch." Advances in the art of pressure-sensing devices had shown that pressures recorded by deformation of copper crusher cylinders are not necessarily a true measure of pounds per square inch for the transient phenomena encountered in sporting arms ammunition.

4. Material – High carbon steel – heat treat R<sub>c</sub> 62-63
5. Pistons to be suction fit in piston holes.
6. (XX.XX) = Millimeters.

Due to the variation in the distance from the chamber wall to the outside edge of the test barrel caused by variation in cartridge diameters, “short” (pressure measurement) pistons for different cartridges are required to be different lengths. This table presents the appropriate short piston lengths for test barrels made in accordance with the drawings and other requirements in Section III.

Cartridge	Piston Diameter		Piston Length Recommendation	
	Inches	mm	Inches	mm
6x45mm	N/E

---

## **PISTON OIL – PISTON AND GAS CHECK**

---

It is recommended that pistons and gas checks (other than those filled with gas check wax) be lubricated with the following oil:

SAE 30 or equivalent

Viscosity at 210°F (98.9°C)

58 Saybolt seconds universal, minimum

70 Saybolt seconds universal, maximum

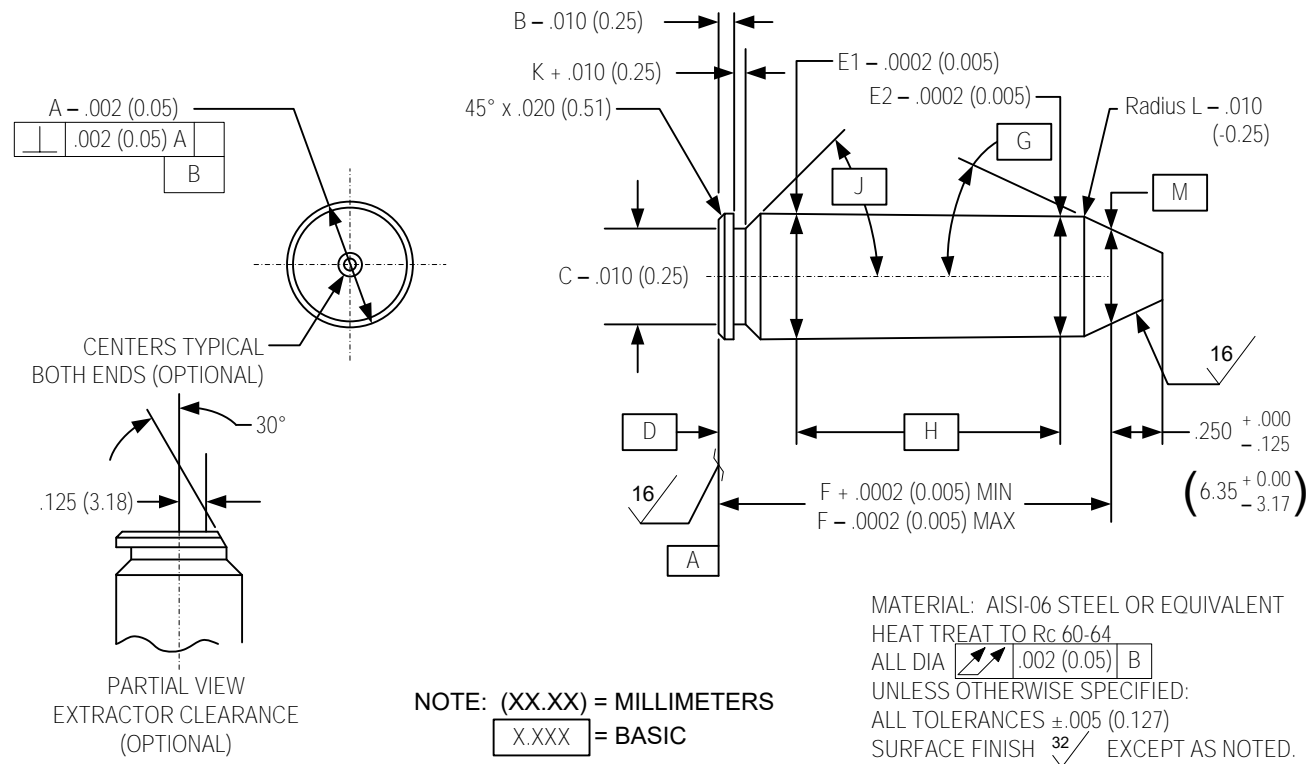

The oil should be of non-detergent type.

---

**EQUIPMENT:  
REFERENCE AMMUNITION SUPPLY**

---

**NOTE:** Refer to Section III – page 223, *Supplier Contact Information*, for detailed information on contacting the manufacturers of listed products and the SAAMI Technical Office.

Centerfire rifle reference ammunition for the verification of ranges, barrels, and other equipment may be obtained from the manufacturer. Contact the SAAMI Technical Office or see website for detailed information.

The SAAMI Technical Office maintains current assessment data. SAAMI policy does not allow the release of assessment values by the manufacturer of reference ammunition. All assessments are to be supplied by the SAAMI Technical Office.

---

**EQUIPMENT:**  
**REFERENCE AMMUNITION ORDER PROCEDURE**

---

Each order should contain the following information, in the following order:

1. Number of rounds desired. (See NOTE, below.)
2. Appropriate order symbol, when given.
3. Designation “SAAMI Reference Ammunition”.
4. Cartridge name.
5. SAAMI lot number. (Current lot numbers are given on latest assessment value sheets issued by the SAAMI Technical Office.)

**EXAMPLE:**

100 rounds, Order symbol SA22H2  
SAAMI Reference Ammunition  
22 Hornet  
SAAMI Lot 22HOR-46-11WW

NOTE: Recommended maximum order = 100 rounds. If an individual user has requirements for larger quantities, refer to Section II – page 182.

**Manufacturers of SAAMI reference ammunition may limit the order quantities honored to the recommended maximum in order to prevent premature consumption of a lot.**

It is up to the discretion of the manufacturer to produce lots of sufficient size to reasonably provide a five-year supply.

---

**SUPPLIER CONTACT INFORMATION**

---

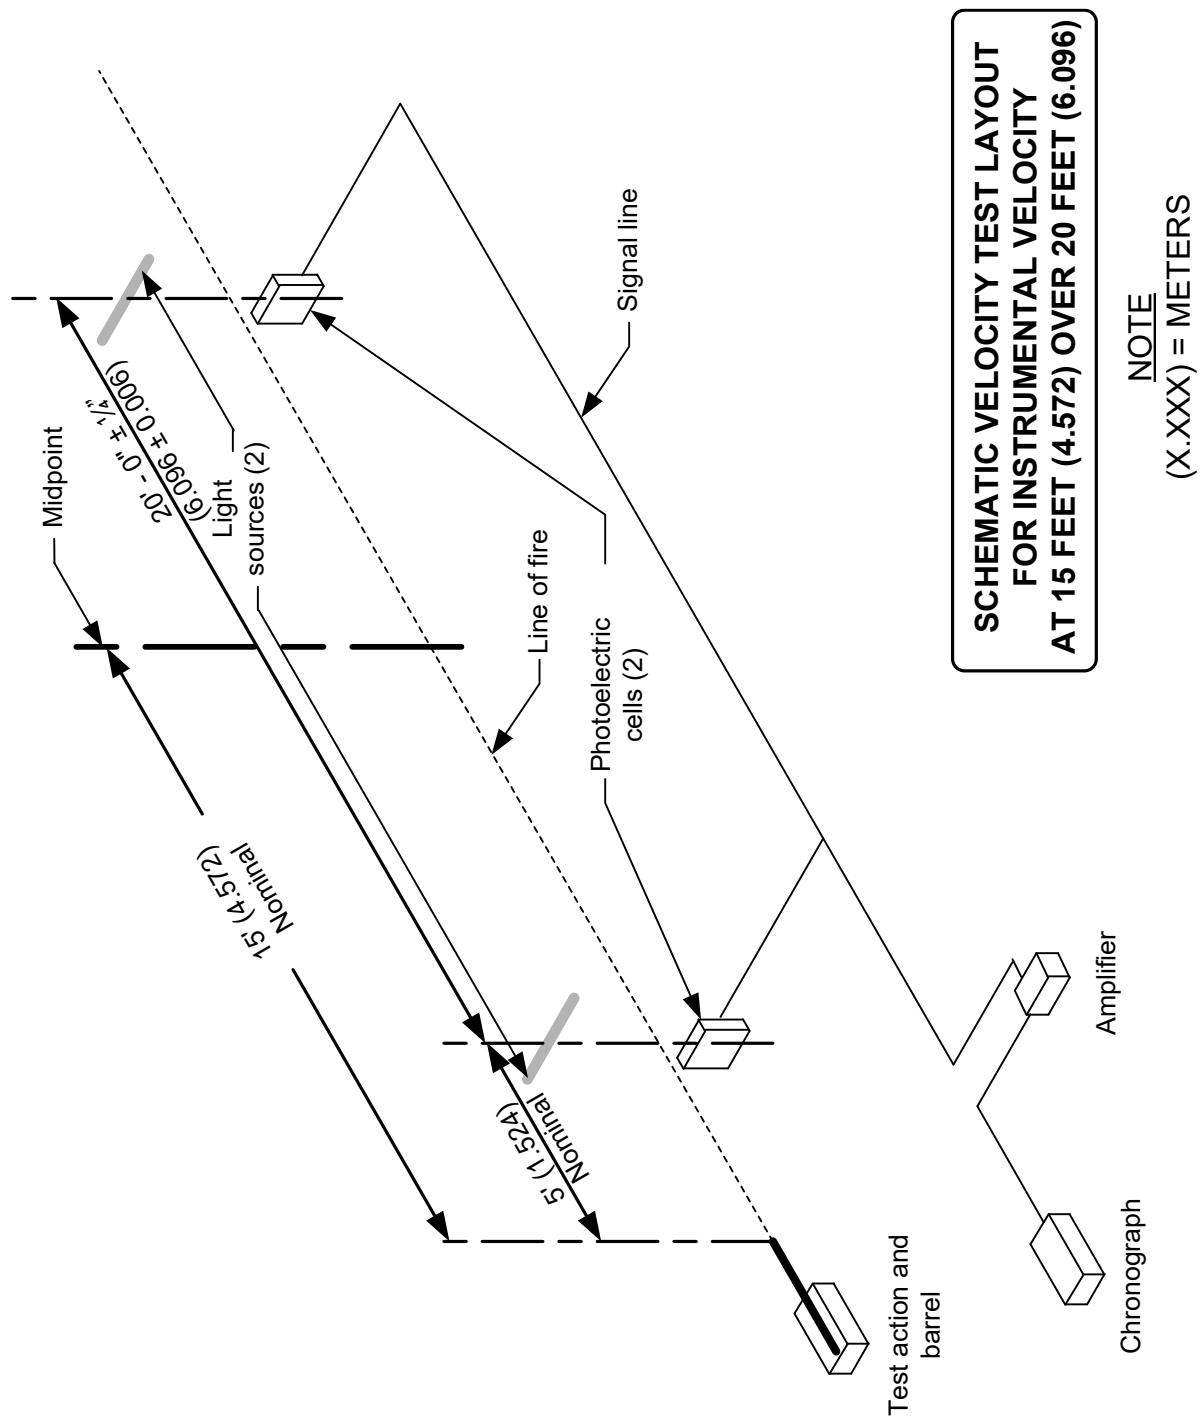

Contact the SAAMI Technical Office using the information below or visit [www.saami.org](http://www.saami.org) for a current list of supplier contact information.

HARDNESS 277 TO 321 ( $R_c$  29 TO 35)  
ACCEPTABLE ALTERNATE: 416 STAINLESS STEEL

## UNIVERSAL RECEIVER TEST BARREL: INSTALLATION OF PRESSURE TRANSDUCERS

### 1. LARGE [.250 (6.35)] DIAMETER GAUGES

**NOTE**  
 (XX.XX) = MILLIMETERS

## UNIVERSAL RECEIVER TEST BARREL: INSTALLATION OF PRESSURE TRANSDUCERS

### 2. SMALL [.196 (4.98)] DIAMETER GAUGES

**NOTE**  
 (XX.XX) = MILLIMETERS

**EQUIPMENT:  
TRANSDUCER CALIBRATION FIXTURE PLUG  
WITH O-RING SEAL (OPTIONAL)\***

**NOTES**

MATERIAL: 3/4-16 UNF X 1 1/2 LONG R.H. (GRADE 8) STEEL HEX BOLT  
ALL DIA. TO BE CONCENTRIC WITHIN .001 T.I.R.

UNLESS OTHERWISE NOTED ALL TOLERANCES ARE ± .005 (0.13)

\* NOT TO EXCEED 65,000 PSI.

## **TRANSDUCER LOCATION CRITERIA**

---

### **I. Transducer Location**

The following criteria for transducer location positioning should be followed when designing new cartridges. In those cases where following the criteria will cause the transducer to be located over current or projected bullet heel locations, case cannellures, or other undesirable areas, the best alternate location should be chosen. In general, the location should be as close to the bullet heel as practical.

#### **A. Straight-walled Cartridge Cases**

The centerline of the transducer shall be located behind the heel of the bullet by an amount equal to one-half the transducer diameter plus 0.005” – 0.010” (0.13 mm – 0.25 mm). This criterion applies to both large diameter [0.250” (6.35 mm)] and small diameter [0.194” (4.93 mm)] transducers.

#### **B. Bottleneck Cartridge Cases**

The centerline of the transducer shall be located behind the shell case shoulder intersection by an amount of 0.175” (4.44 mm) for large diameter [0.250” (6.35 mm)] transducers and by 0.150” (3.80 mm) for small diameter [0.194” (4.93 mm)] transducers.

### **II. Transducer Diameter**

#### **A. Large Diameter [0.250” (6.35 mm)] Transducers**

This size is selected when the chamber diameter at transducer centerline is equal to or greater than 0.350” (8.89 mm).

#### **B. Small Diameter [0.194” (4.93 mm)] Transducers**

This size is selected when the chamber diameter at transducer centerline is less than 0.350” (8.89 mm).

---

**STANDARD V&P TEST BARRELS - GENERAL:  
PROCEDURES FOR DIMENSIONING CHAMBERS**

---

Chamber and bore dimensions of velocity and pressure test barrels shall conform to the dimensions of the chamber and bore at Maximum Material Condition (MMC) for each cartridge as originally introduced. Fabrication tolerances, however, are much reduced.

It is recognized that changes may be made to cartridge or chamber dimensions in order to improve the velocity-pressure relationship, accuracy or functioning in rifles as production experience indicates. However, none of these changes should be of such nature that they would cause a significant increase in pressure level of a given lot of ammunition.

No changes shall be made to velocity and pressure barrel dimensions which would result in a reduction of the recorded pressure level of any given lot of ammunition. This would result in the possibility of future lots of ammunition being loaded with increased powder charges, which would cause increased pressure in existing rifles.

Production barrels may be adapted for velocity and pressure testing provided that they conform to all dimensions shown on the appropriate test barrel drawing.

Except as noted below, all standard test barrels shall be 24.00 inches long (609.6 mm). Exterior ballistic data for all centerfire rifle cartridges shall be based on this length.

**Exceptions** - Test barrel lengths for the following calibers are as shown:

- 7.62x39 – 20.00 inches (508.0mm)
- 30 Carbine – 20.00 inches (508.0mm)
- 300 AAC Blackout – 16.00 inches (406.4 mm)
- 350 Remington Magnum – 20.00 inches (508.0mm)
- 44 Remington Magnum – 20.00 inches (508.0mm)

---

## **STANDARD V&P TEST BARRELS - GENERAL: PROCEDURES FOR MEASURING BARREL LENGTH**

---

Centerfire rifle test barrels are measured by inserting a rod down the bore from the muzzle until it touches the breech face with the action closed and the firing pin retracted.

A stop collar or other means is utilized to mark the point on the rod adjacent to the most forward part of the barrel or the bottom of the counterbore in barrels having a counterbore recess at the muzzle.

The rod is removed and the distance from the mark to the end of the rod is measured. This measurement is recorded as the barrel length.

## 8mm Remington Magnum V&P Test Barrel

Issued: 05/20/1980

Revised: 12/30/2004

**DO NOT SCALE FROM DRAWING**

NUMBER OF GROOVES: 6  
WIDTH OF GROOVES:  $\text{.122} + .005$  (3.10 + 0.13)  
TWIST RATE: 10.00 (254.0) R.H.  
DIAMETER OF PISTON HOLE:  $\text{.206}$  (5.23)  
TRANSDUCER DIAMETER:  $\text{.250}$  (6.35)

LAND AND GROOVE DIMENSIONS TO BE  
WITHIN TOLERANCES THROUGHOUT  
LENGTH OF BARREL.

UNLESS OTHERWISE NOTED,  
ALL DIAMETERS  $+ .0005$  (0.013)  
LENGTH TOLERANCE  $+ .005$  (0.13)

**NOTE:**

B = BASIC                       $\Delta$  = REFERENCE DIMENSION                       $\otimes$  = HEADSPACE DIMENSION  
\* DIMENSIONS ARE TO INTERSECTIONS OF LINES                      (XX.XX) = MILLIMETERS  
ALL CALCULATIONS APPLY AT MAXIMUM MATERIAL CONDITION (MMC)

## 9.3 x 62 V&P Test Barrel

Issued: 01/14/2013

Revised: 08/16/2015

**DO NOT SCALE FROM DRAWING**

HIGHLIGHTED DIMENSIONS HAVE NO CORRESPONDING C.I.P. ANALOG. THE ENGLISH UNITS FOR THESE ARE THE ORIGINAL VALUES; METRIC VALUES ARE CALCULATED AND ROUNDED.

NUMBER OF GROOVES: 4

WIDTH OF GROOVES:  $4.60 + .05$  (.181 + 0.002)

TWIST RATE: 360.0 (14.17) R.H.

BARREL LENGTH:  $609.60 \pm 0.25$  (24.000 ± .010)

DIAMETER OF PISTON HOLE: Crusher pressure not established.

TRANSDUCER DIAMETER: 6.35 (.250)

LAND AND GROOVE DIMENSIONS TO BE  
WITHIN TOLERANCES THROUGHOUT  
LENGTH OF BARREL.

UNLESS OTHERWISE NOTED,  
ALL DIAMETERS +0.013 (.0005)  
LENGTH TOLERANCE + 0.13 (.005)

### NOTE:

B = BASIC

$\Delta$  = REFERENCE DIMENSION

$\otimes$  = HEADSPACE DIMENSION

\* DIMENSIONS ARE TO INTERSECTIONS OF LINES

(XX.XXXX) = INCHES

ALL CALCULATIONS APPLY AT MAXIMUM MATERIAL CONDITION (MMC)

## Revised: - -/- - -/- - - -

UNLESS OTHERWISE NOTED,  
ALL DIAMETERS +.0005 (0.013)  
LENGTH TOLERANCE + .005 (0.13)

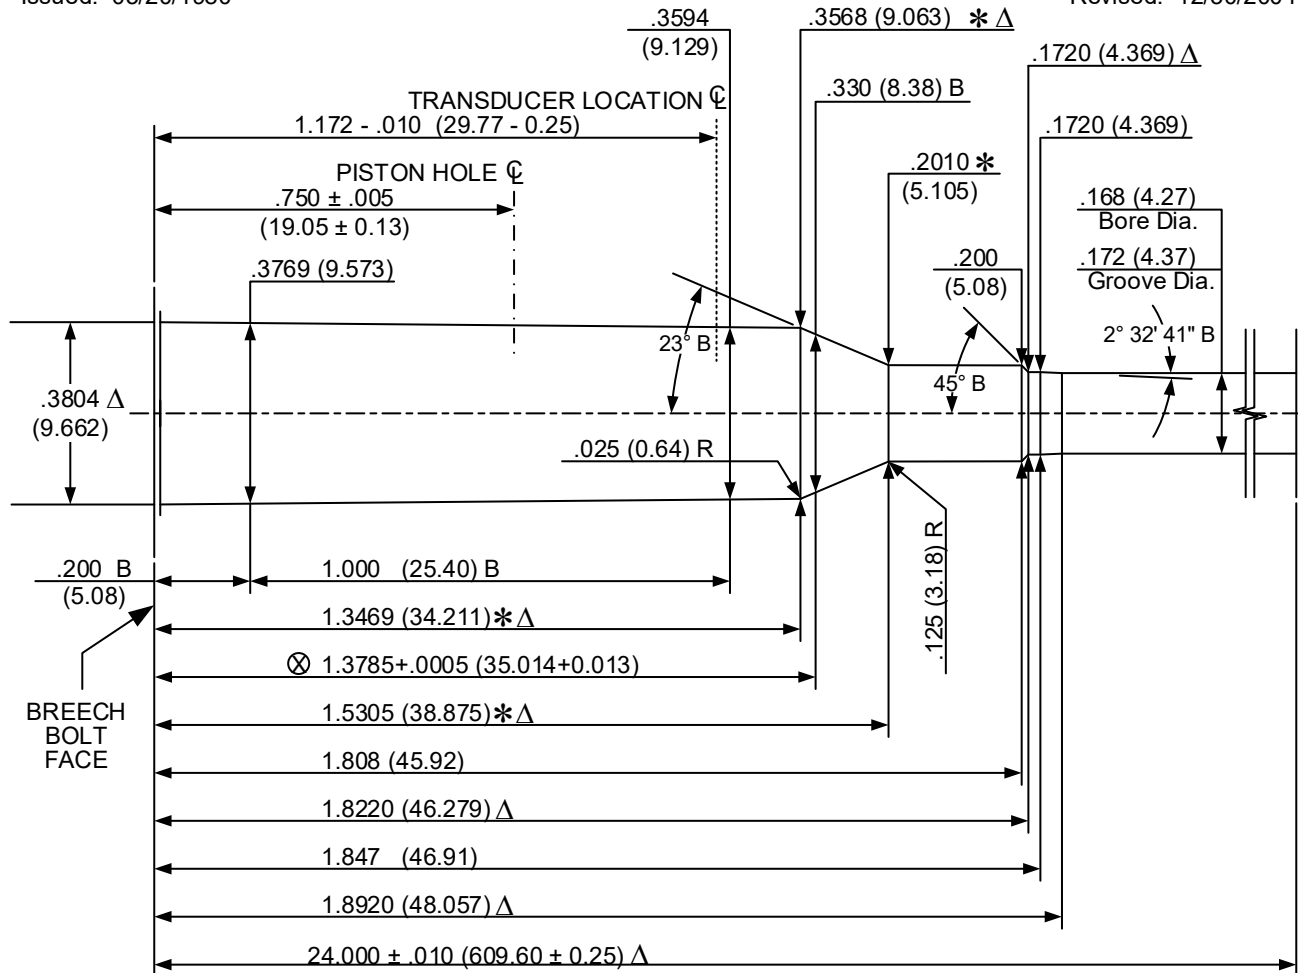

ALL CALCULATIONS APPLY AT MAXIMUM MATERIAL CONDITION (MMC)

## 17 Remington V&P Test Barrel

Issued: 05/20/1980

Revised: 12/30/2004

DO NOT SCALE FROM DRAWING

NUMBER OF GROOVES: 6

WIDTH OF GROOVES: .062 + .002 (1.57 + 0.05)

TWIST RATE: 9.00 (228.6) R.H.

DIAMETER OF PISTON HOLE: .206 (5.23)

TRANSducer DIAMETER: .250 (6.35)

LAND AND GROOVE DIMENSIONS TO BE  
WITHIN TOLERANCES THROUGHOUT  
LENGTH OF BARREL.

UNLESS OTHERWISE NOTED,  
ALL DIAMETERS  $\pm$  .0005 (0.013)  
LENGTH TOLERANCE  $\pm$  .005 (0.13)

### NOTE:

## DEFINITION AND PURPOSE

---

SAAMI Definitive Proof cartridges are cartridges commercially loaded by SAAMI member companies which develop pressure substantially exceeding those developed by normal service loads. The pressure levels are designed to assure gun safety when using ammunition loaded to service pressures in accordance with accepted American practices.

Proof cartridges are designed to stress firearms components which contain the cartridge in order to assure safety in the recommended use of the firearm during its service life.

It is important from the safety standpoint that Definitive Proof cartridges be used **only** for the proof of firearms. Adequate precaution must be taken to protect personnel performing firearms proof testing.

The supply of Definitive Proof cartridges will be the responsibility of the company that first introduced that particular caliber to the Institute. Definitive Proof Cartridges should be loaded with the heaviest bullet used at the time of introduction and the slowest powder which will meet the pressure values indicated for that particular cartridge to maintain effective pressure-distance relationship. Once established, the bullet weight for the proof load does not change unless the bullet becomes obsolete. All changes in Definitive Proof cartridges bullet weight must be approved by the Joint Technical Committee.

**NOTE:** The heat treatment of cartridge cases for definitive proof loads may be different from the treatment of service cases, at the option of the manufacturer.

Other case modifications to minimize firing casualties such as gas leakage around primers are also permissible. The use of such options must not affect the stressing of the firearm's components.

PROOF PRESSURE DATA - CRUSHER

Cartridge	Bullet Weight (grains)	SERVICE Maximum Average Pressure (CUP/100)	Pressure Values of Proof Cartridges <sup>(1)</sup>

## PROOF LOAD SUPPLY

---

**NOTE:** Refer to Section III – page 223, *Supplier Contact Information*, for detailed information on contacting the manufacturers of listed products and the SAAMI Technical Office.

Centerfire rifle Definitive Proof Loads should be used for one purpose only: the proof testing of Centerfire rifles.

A list of current suppliers may be obtained from the SAAMI Technical Office.

## PROOF CARTRIDGE IDENTIFICATION

---

## DEFINITIVE PROOF PACKAGE IDENTIFICATION

---

### HIGH PRESSURE PROOF LOADS

For Gun Manufacturers' Proof Test Use Only: Fire only from fixed rest with operator properly protected from injury should the firearm be damaged. Purchaser should restrict proof loads to manufacturing premises. To dispose of proof loads, contact producer for instructions.

DO NOT reload or dispose of fired proof shells in a manner that may make them available for reloading. **Failure to follow the foregoing can result in a personal injury.**

Centerfire proof loads are identified by a tin-plated case (or visual equivalent) with red lacquer on the bullet and case head face.

For consistent results, proof loads should be stored for 2 weeks at  $70^{\circ}\text{F} \pm 5^{\circ}$  ( $21.1^{\circ} \pm 2.8^{\circ}\text{C}$ ), and 60% relative humidity before use.

**"WARNING: KEEP OUT OF REACH OF CHILDREN"**

(Red lettering on white background)
